GIT commands

1. **GIT init**

    Shortcut for GIT initialize. It's the first command we should use for a new project because it creates a new repo

2. **GIT add**

    We use this command when we have an update in the working directory and need to add it to the staging area

3. **GIT status**

    It's a command used to display the status of the working directory and its files (which has been tracked or not)

4. **GIT log**

    It's used to show all the reachable commits

5. **GIT commit**

    It's the next step after GIT add because it saves the updates we have launched. It's like a snapshot

6. **GIT push**

    It's used to upload our repo to a remote one
